Why do dryer fires happen?

Different parts of a residential inspection.

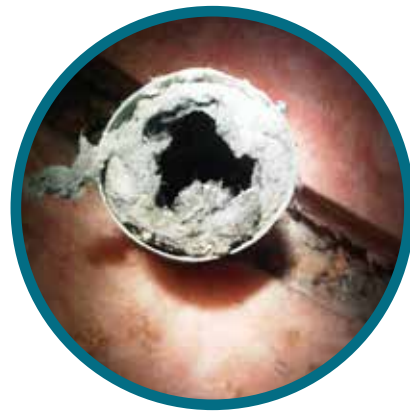

Dryer fires often occur due to lint buildup inside the appliance cabinet. Over time, lint accumulates on top of the heating panel, wiring, and exhaust blower housing – creating a real fire hazard!

Having the dryer vent system along with the clothes dryer inspected is the safest defense against preventing a dryer fire.

Lint Check™ Dryer Vent Systems, Safety Services, Helps Prevent Dryer Fires® by removing the hazard of combustible lint inside the Dryer Vent Systems and maintain peak efficiency with the dryer.

Roof Exhaust Vent Blockage

A Clogged Vent

Example Of Plastic Vents That Can Cause A Fire Hazard.

Venting

A metal dryer vent is the main component to ventilate and exhaust moisture from the dryer to the outside environment.

Transition Vents

Many dryer installations require a transition vent in order to connecting the dryer to the dryer vent systems. **Having a flexible foil or plastic transition vent is considered a fire hazard by the dryer manufactures.**

There are warning labels on the back of the dryers regarding these fire hazards.

Blower

There are many dryer vent systems equipped with a blower fan to assist the dryer. Many blower fans not maintained will effect the dryer efficiencies and create a dryer fire hazard.

Exhaust

Dryer vent systems are equipped with an outside exhaust vent. Having a maintained dryer & dryer vent systems will help maintain efficiency with the dryer and reduce the environmental impact.

Having a pest guard vent will prevent mice, birds and any little critter problems entering your dryer vent system.

Having a maintained dryer & dryer vent systems will reduce costs and maintain your laundry room fire hazard prevention.

The laundry room - hazard prevention safety inspection, considers the water hazard that rubber water supply lines pose. We highly recommend the installation of steel braided water supply lines and increase your safety factor against water hazards.
